

# Searching your SQL data

Harm Wibier  
Data Access Worldwide

# Why a search?

- Navigation options in are key to a good usability
- Google has raised the standards
- Machines have the capacity for full text searches

The screenshot shows a Google search interface. The search bar contains the text "Data Access Worldwide". Below the search bar, a dropdown menu displays two suggestions: "data access worldwide" and "data access worldwide forums". Below the search bar, the text "About 207,000,000 results (0.61 seconds)" is visible. The search results section shows a link to "Data Access Worldwide - Software products and services for ..." with the URL "www.dataaccess.com/". Below the link, there is a description: "Data Access Worldwide delivers advanced software products and consulting services to help customers build great Windows and Web database applications ...". To the right of the text, there is a map showing the location of "Memorial Plan Dade South Memorial Park" with a red pin. Below the map, there is a "See outside" button. The search results section also includes sections for "Company", "Forum", "Products", and "Data Access Worldwide For...".

Data Access Worldwide ★

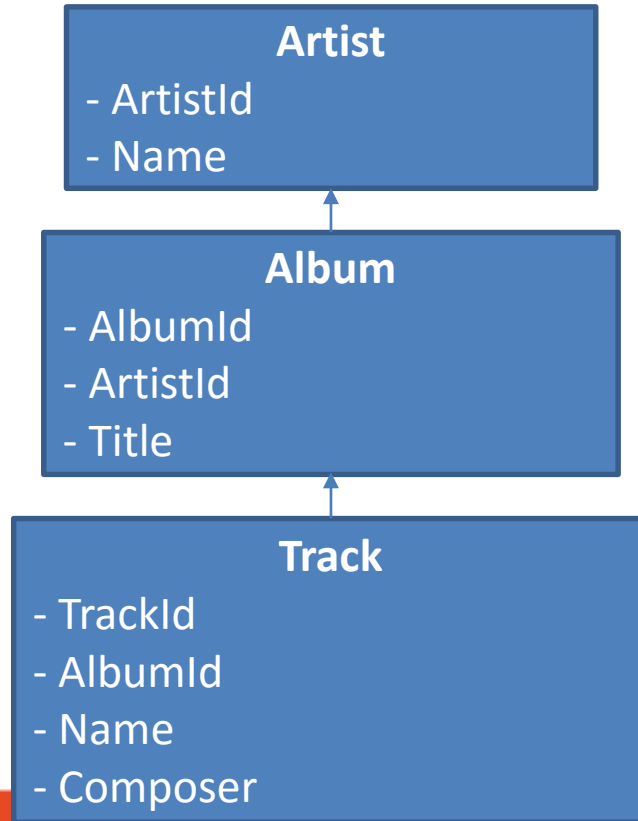

Website Directions

# In DataFlex Applications

- Quickly navigate to a specific entity
  - Central search function in the application
- Easily select parent records
  - Find records in a select
  - Find records in a prompt list

# Chinook database

# SQL Filters

- Filters in the WHERE clause of a SQL query

```
SELECT * FROM Track WHERE Track.UnitPrice > 1
```

# Data Dictionary SQL Filters

- Set psSQLFilter to define
- Enable using pbUseDDSFilters

```
Object oTrack_DD is a Track_DataDictionary
  Set psSQLFilter to "Track.UnitPrice > 1"
  Set pbUseDDSFilters to True
End_Object
```

# psSQLFilter vs Constrain

- Increased performance
  - Filtering offloaded to the server
  - No unnecessary records loaded to the client
- Use advanced SQL filtering options

# SQL LIKE

- Filter based on textual expressions
- Use wildcards like % and \_

```
SELECT * FROM Track WHERE Name LIKE '%Dirty%'
```

# Search filter using LIKE

- Multiple keywords

Name **LIKE** '%Bad%' **AND** Name **LIKE** '%Boy%'

- Multiple fields

(Name **LIKE** '%Bad%' **OR** Composer **LIKE** '%Bad%') **AND**  
(Name **LIKE** '%Boy%' **OR** Composer **LIKE** '%Boy%')

Look at a single table search using LIKE filters set on the DD.

# **SAMPLE 1**

# Global helper functions

- **StrJoinFromArray** aStrings sDelimiter
  - Join an array of strings together
- **StrSplitToArray** sString sDelimiter
  - Splits a string into an array of strings

# SQL helpers on DataDictionary

- `SqlStrLike` `iField` `sSearch`
  - Generates a safe like string for the specified field
- `SqlStrFileFieldName` `iField`
  - Gets the SQL field name based on a field number
- `SqlEscapedStr`
  - Escapes a string for usage inside a SQL Filter

# OnConstrain in WebApps

- Triggered during synchronization process
- Make sure that it doesn't change directly on the client
  - Do not read values directly from UI
- Can cause synchronization issues
  - Especially pre 18.2

# SQL Views

- Virtual tables based on resultset of a SQL Query

```
CREATE VIEW TrackNames AS  
SELECT Name FROM Track
```

- Accessible as a table

```
SELECT * FROM TrackNames
```

- Add to your filelist as a table

# Multi table search

- Generate a SQL view concatenating the tables
  - Use SQL UNION statement
  - Put search text in a single field
- Access the view like a regular table in DataFlex

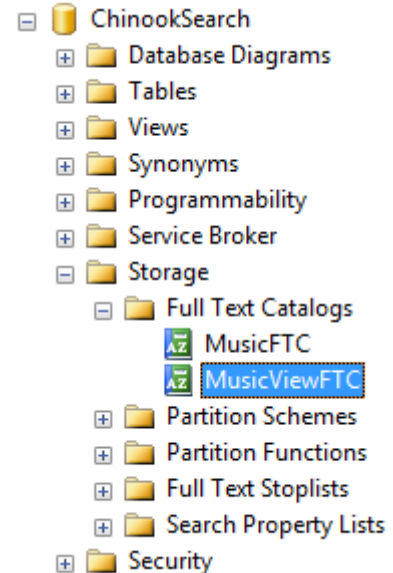

Look at using a view to search multiple tables.

# **SAMPLE 2**

# SQL Full Text Search

- Full text search indexing
- Separate service
- Available on all MS SQL versions
  - Not always installed by default
- Create catalog
  - Add fields

# Why SQL full text search?

- Better performance with large amounts of data
- Language enhancements
- Relevance rating
- Highly configurable
  - Scheduled population

# FREETEXT function

- Returns true or false
- Filter on keywords
- Columns must be part of full text catalog

```
SELECT * FROM Track WHERE FREETEXT ((Name, Composer), 'Body Count')
```

Look at using the FREETEXT filter.

# **SAMPLE 3**

# FREETEXTTABLE function

- Returns a table with KEY and RANK columns
  - Key refers to the primary key of the searched table
  - Rank indicates the relevance of the found row
- Use in FROM clause
- JOIN actual data on KEY

```
SELECT * FROM FREETEXTTABLE (Track, (Name, Composer), 'Body Count') AS FTS  
ORDER BY RANK DESC;
```

# Full Query

**SELECT**

TrackId,  
Track.Name **AS** Name,  
Composer,  
Album.Title **AS** Album,  
Artist.Name **AS** Artist,  
FTS.**Rank AS** SearchRank

**FROM** Track

**INNER JOIN FREETEXTTABLE** (Track, (Name, Composer), 'Body Count') **AS** FTS  
**ON** Track.TrackId = FTS.[KEY]

**LEFT JOIN** Album **ON** Track.AlbumId = Album.AlbumId

**LEFT JOIN** Artist **ON** Album.ArtistId = Artist.ArtistId

**ORDER BY RANK DESC;**

# Use embedded SQL

- Manually filled list
  - Implement OnManualLoadData
    - Execute search statement
    - Read result set into tWebRow[]
- Use GridRefresh to fill

Single table full text search sorted on rank.

# **SAMPLE 4**

# Stored procedure

- Creates a procedure on the SQL database
- Call using embedded SQL API
- Pass filter as parameter

```
CREATE PROCEDURE SearchMultiTable  
@SearchString nvarchar(255)  
AS  
...  
RETURN
```

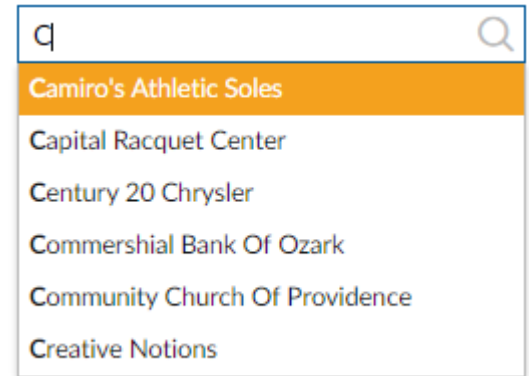

Multi table text search using UNION and embedded SQL sorted by rank.

# **SAMPLE 5**

# SuggestionForm

- Did you know the suggestionform?
  - ❑ Available for windows and web
  - ❑ Ideal for finding parents without lookup
  - ❑ Easy to configure using Entry\_Item
  - ❑ Full text find using LIKE on MS SQL
  - ❑ Extendable

A screenshot of a search input field with a dropdown list of suggestions. The input field contains the text 'q' and a magnifying glass icon. The dropdown list is open and shows the following suggestions:

- Camiro's Athletic Soles
- Capital Racquet Center
- Century 20 Chrysler
- Commerstial Bank Of Ozark
- Community Church Of Providence
- Creative Notions

# Extract keywords

- Use MS SQL system function
  - `sys.dm_fts_index_keywords`

```
SELECT * FROM sys.dm_fts_index_keywords(db_id('ChinookSearch'), object_id('dbo.Track'))  
WHERE display_term LIKE ('ama%')
```

Search with keyword suggestions.

# **SAMPLE 6**

# Comparison

## LIKE filters

- Easier to build
  - DD Filter
  - Data Aware Lists
  - Full control in DF
- Take advantage of views

## Full Text Search

- Harder to build
  - Embedded SQL
  - Manually filled list
  - Configuration on the database
- Smarter results
- Better performance on large data sets
